

Nutrient recovery from municipal wastewater using ED/EDI

Rubaba Mohammadi

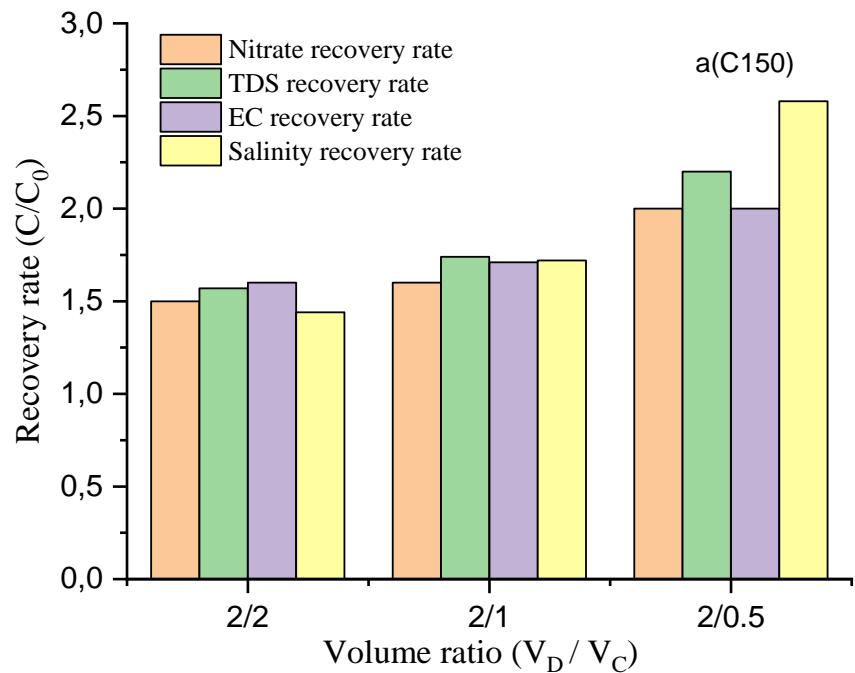

Objectives:

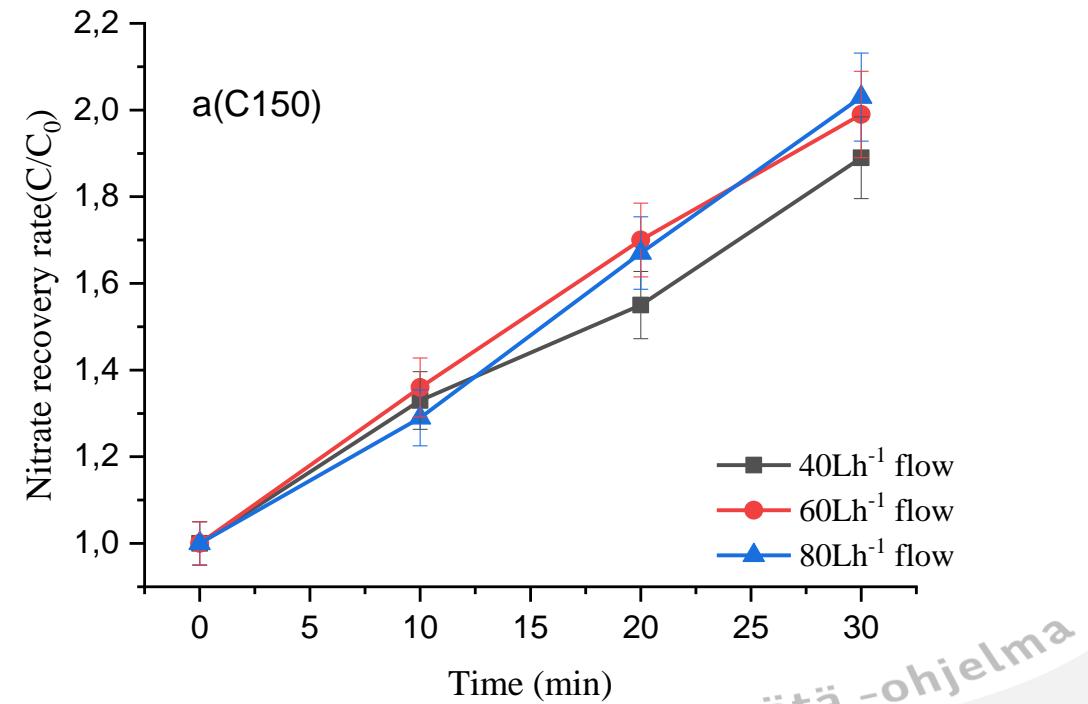

ED and EDI

- Optimization of nutrient recovery from different source point of wastewater treatment plant
- Compare the products
- Compare the energy consumption
- Cost

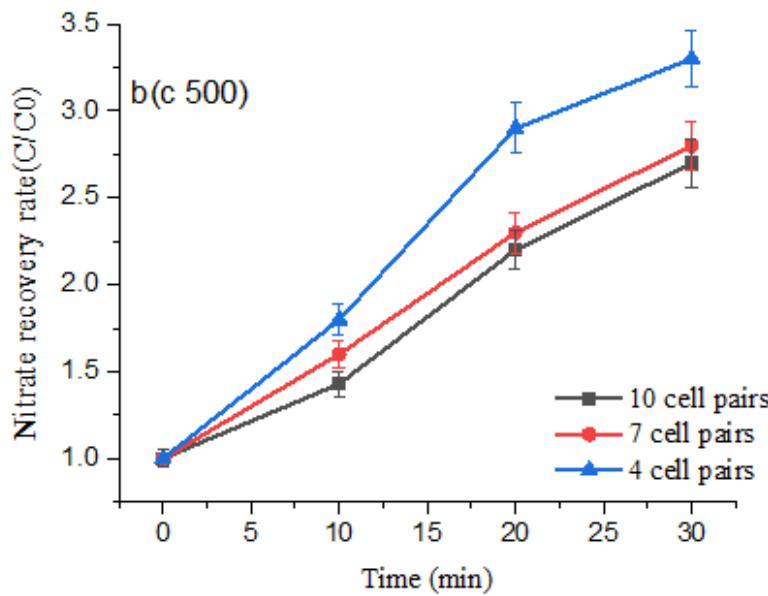

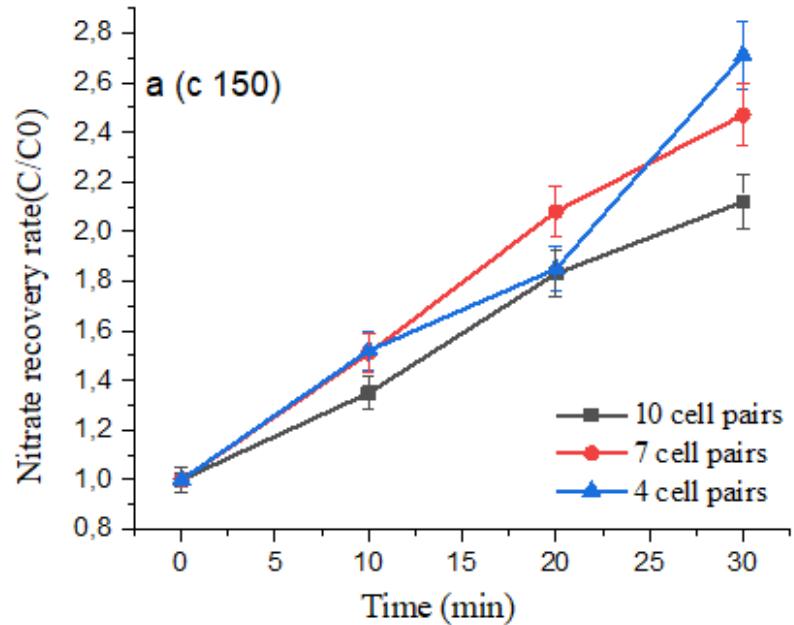

Effect of volume and flow rate:

Operating time: 20 minutes, voltage: 6.6 v

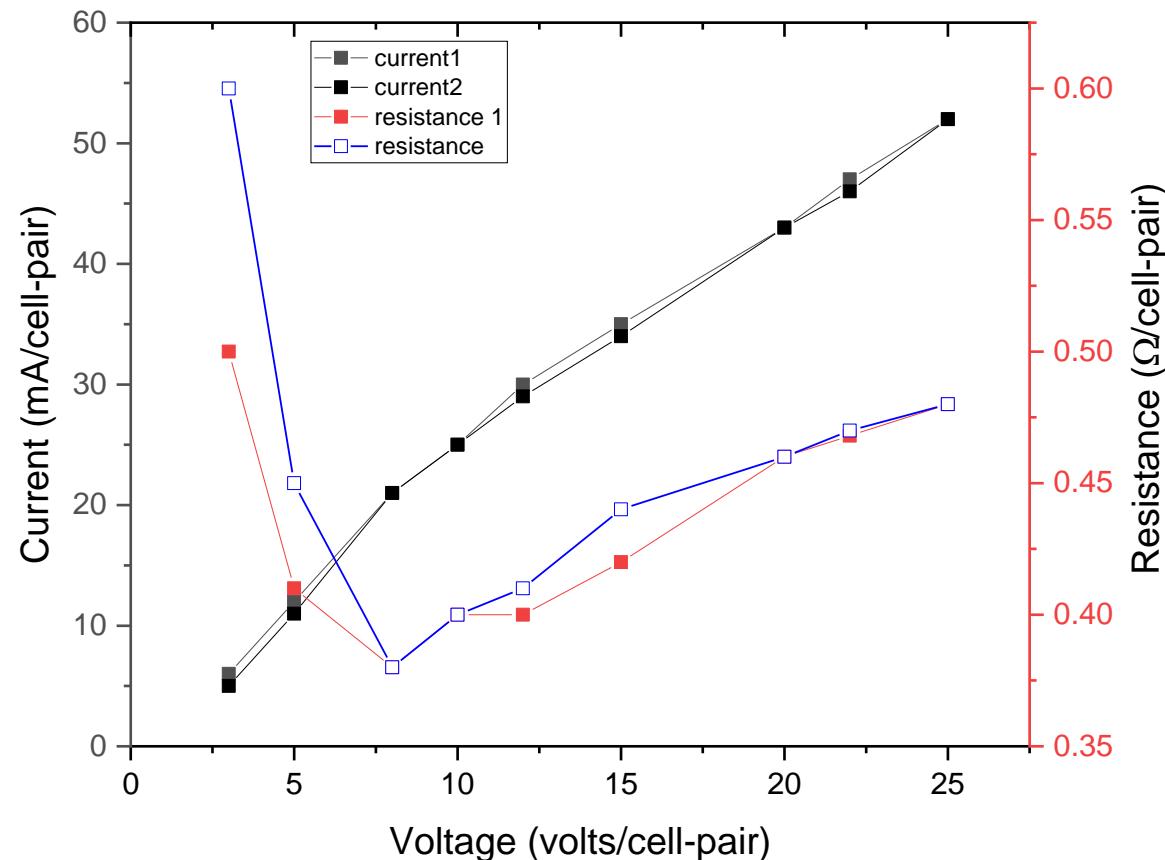

Effect of cell pairs:

The recovery rate of nitrate as a function of the cell pairs in 150 and 500 mg L⁻¹ NO₃⁻ concentration (flow rate 60 L h⁻¹, operation time 30 min, VD/VC 2/0.5).

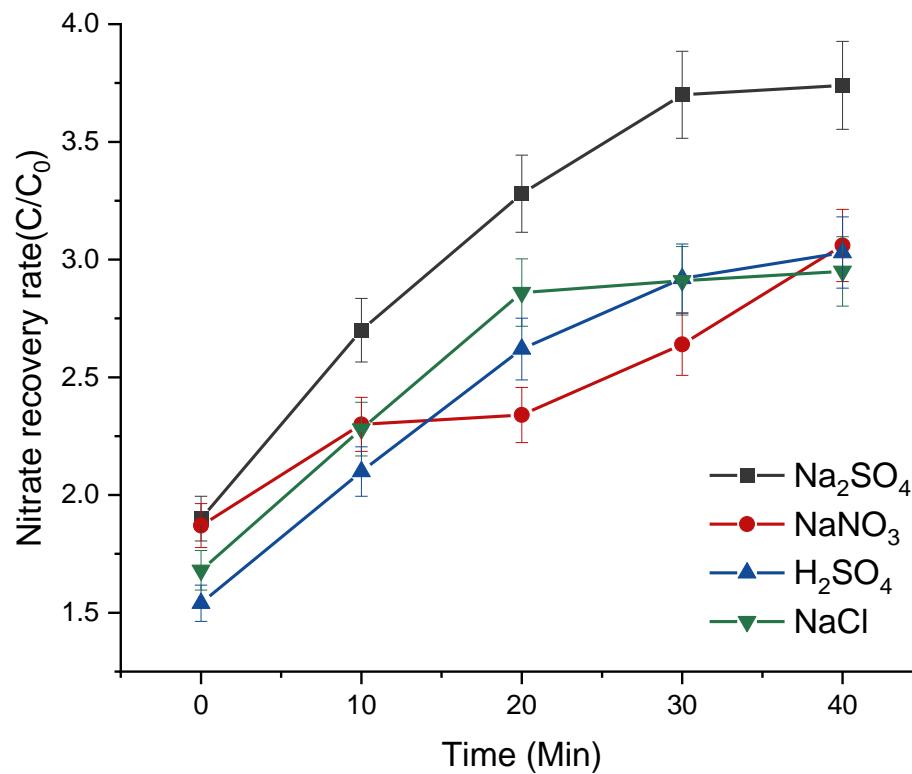

Nutrient recovery in present of other ions from MBR effluent:

Limiting current density of multi anions solution and
MBR permeate

Effect of different electrolyte type on ED efficiency (secondary settling clarifier):

Nutrient recovery in present of other ions (secondary settling clarifier and MBR):

Two stage batch ED on nitrate efficiency (secondary settling clarifier):

Effect of multi-stage batch ED on NO_3^- recovery and removal rate minus rate numbers represent the removal rate

Process design of the two-stages-batch ED system.

Parameter	Table	World Health Organization	European Union	Potable water	Diluted product	wastewater	Concentrated product	Concentrated product(s stage2)
Aluminum	Al		0,2 mg L ⁻¹	0.03	0	0.02	0.03	0.05
Cadmium	Cd	3 µg L ⁻¹	5 µg L ⁻¹		0	0	0	0
Calcium	Ca	mg L ⁻¹		56.92	0	52.4	214.48	850
Chromium	Cr	50µg L ⁻¹	50 µg L ⁻¹	0	0	0	0	0
Copper	Cu	"	2.0 mg L ⁻¹	0.26	0	0.02	0.03	0.07

Fouling:

TOC analysis : The TOC content decreased from $10.19 \pm 1.2 \text{ mg L}^{-1}$ to the average $6.32 \pm 0.5 \text{ mg L}^{-1}$ in the diluted stream in 120 min, respectively; while it increased to average of 16.32 ± 1.5 and 25 mg L^{-1} in concentrated solution after ED treatment in 2 cycles 120 min, respectively.
